

# Obesity Update 2020

## Surgery for Weight Loss

# Faculty/Presenter Disclosure

- **Faculty: Daniel Birch**
- **Relationships with commercial interests:**
  - **Grants/Research Support: -**
  - **Speakers Bureau/Honoraria: Obesity Canada**
  - **Consulting Fees: -**
  - **Other: -**

# Disclosure of Commercial Support

- **Potential for conflict(s) of interest:**
  - **Dr. Daniel Birch** has not received payment/funding from companies exhibiting in this program AND/OR companies whose product(s) are being discussed in this program.
  - **The exhibitors did not provide content for Obesity Update 2020 nor did they have any editorial input or involvement with the selection of Dr. Birch as a speaker.**
  - **The Royal Alexandra Hospital Foundation and/or Centre for Advancement of Surgical Education & Simulation (CASES) has not developed /licensed / distributed/ benefited from the sale of any product that is discussed in this program**

# Goals of Presentation

To support physicians in practice confidently and appropriately discussing and referring patients for weight loss surgery

To improve patient access and referral for management of obesity and comorbid disease

To reduce or eliminate the need for patients to travel out of province/country for weight loss surgery

# Learning Objectives

At the conclusion of this session, participants will be able to:

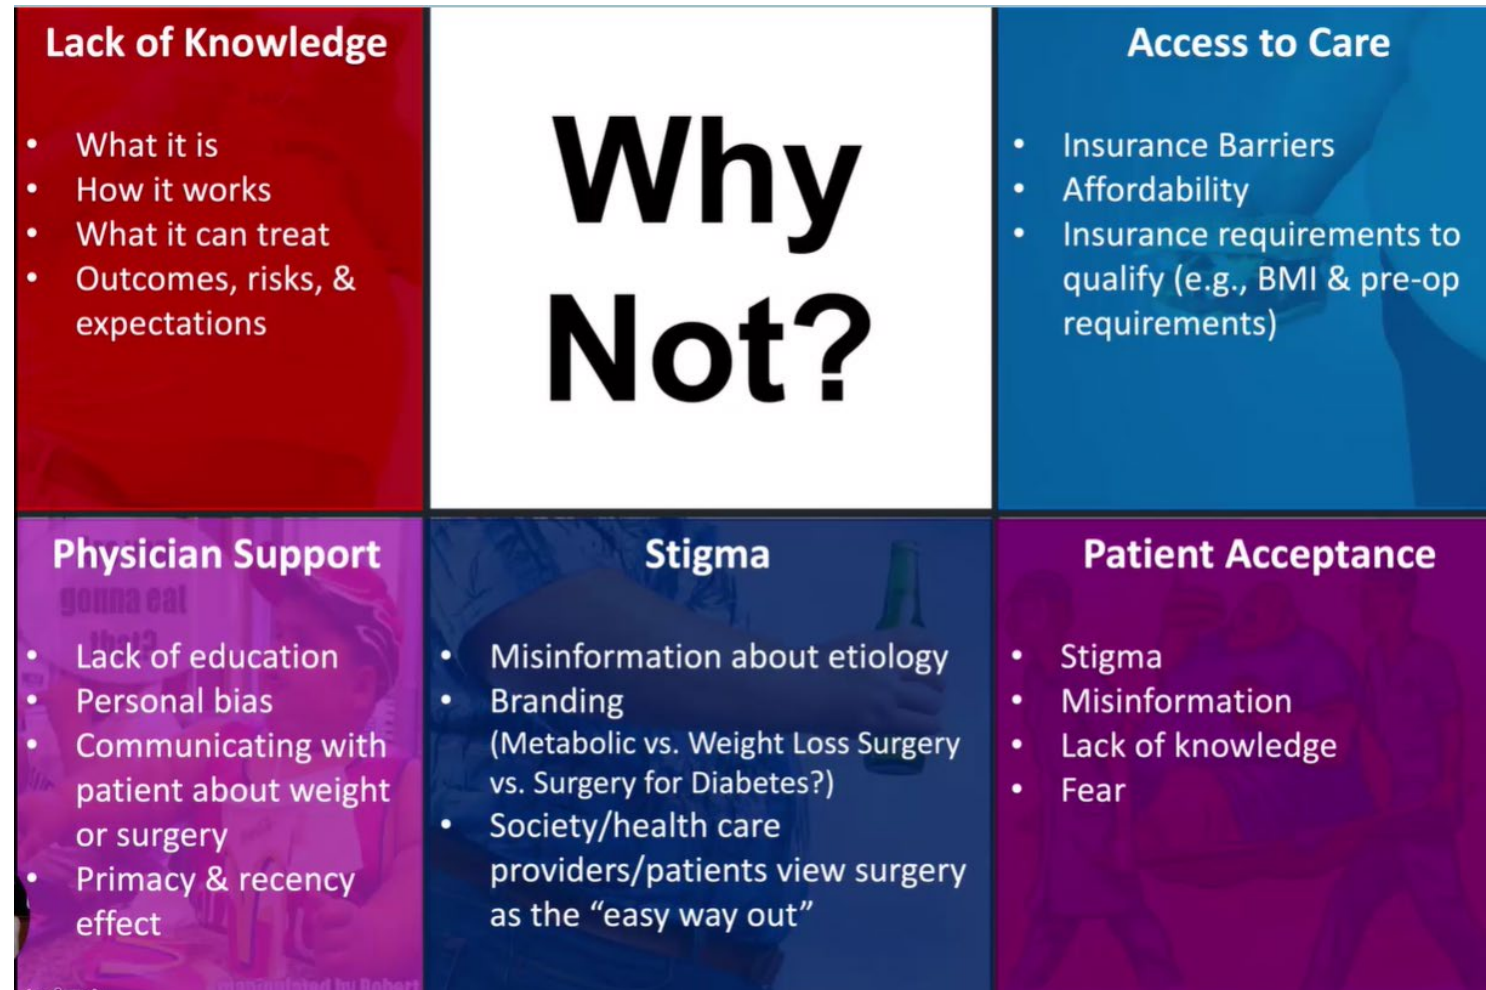

- **Select individuals for whom bariatric surgery is appropriate**
- **Initiate a referral to a tertiary care center and comprehend the clinical process and timelines**
- **Explain how each bariatric surgery type facilitates weight loss**
- **Evaluate surgery's impact on patients' obesity and related comorbidities, quality of life, and mortality**
- **Identify postoperative complications of bariatric surgery and employ appropriate management including re-referral to tertiary care**

# Challenges of Knowledge Translation

- **Knowledge translation:** referred to as the “knowledge to action” process
- **Changing behaviours of physicians in practice is very challenging – if not impossible!**
- **Knowledge sharing without knowledge transfer not effective**
- **Parallel: Influencing patients and their beliefs in healthcare – similarly challenging**

***How do we improve the knowledge to action process in obesity management?***

# Barriers to Weight Loss Surgery

[Kelli Friedman—To Have Surgery or Not: The Psychology Behind the Decision – CME \(cmevirtual.com\)](https://cmevirtual.com)

# Knowledge translation strategies – what works?

---

What do you need to evolve your practice in obesity?

---

1. General medical conferences (2-3d)

---

2. Focused workshops (1d)

---

3. Mentoring (1 on 1 experience)

---

4. Podcasts (independent experience)

---

5. Other (specific study type...)

Here's my first #keto menu for my fellow people that are on this journey with me!  
1 cup of coffee with stevia and a splash of sugar free coffee mate.  
Breakfast- Two eggs, Cholula garlic hot sauce and arugula wrapped in Parmesan Folios cheese wraps (purchased at Costco)  
Lunch- sautéed zucchini noodles (cecees veggie company noodles) bought at Whole Foods. I just pan fry them in a touch of butter with salt and pepper and they are so satisfying!  
Dinner- Korean beef bowl. I sautéed cauliflower rice in a pan and then in a separate pan I fry up hamburger then add crushed ginger, coconut aminos, garlic and sesame oil. I top the cauliflower rice with the hamburger blend and then sprinkle green onion... and jolla! It's so hearty and filling! #ketorecipes #ketoweightloss #ketotransformation #ketodiet #weightlossjourney #weightloss #ketolife

# Managing Misinformation in Healthcare

- Remember that ***Facts matter***: correcting misinformation is difficult but essential - despite low impact of evidence and facts, unexpected results
- Recognize the power of a good story: anecdotes very influential, despite low level of evidence
- Encourage vigilance and critical thinking: critical appraisal of evidence, fact checking, understanding levels of evidence
- Embrace better science, better healthcare and the value of trust: know your medicine and your consultants

# Results of Weight Loss Surgery

Sjostrom et al. Effects of Bariatric Surgery on Mortality in Swedish Obese Subjects. *N Engl J Med* 2007;357(8):741-52

# Weight Loss Surgery Adds Years

**Figure 2. Unadjusted Cumulative Mortality.**

The hazard ratio for subjects who underwent bariatric surgery, as compared with control subjects, was 0.76 (95% confidence interval, 0.59 to 0.99; P=0.04), with 129 deaths in the control group and 101 in the surgery group.

Adams et al, Long-Term Mortality after Gastric Bypass Surgery N Engl J Med 2007; 357:753-761

Sjostrom et al. Effects of Bariatric Surgery on Mortality in Swedish Obese Subjects. N Engl J Med 2007;357(8):741-52

# Long term mortality following Gastric Bypass Surgery

- **During a mean follow-up of 7.1 years, adjusted long-term mortality from any cause in the surgery group decreased by 40%**
- **Cause-specific mortality in the surgery group decreased by 56% for coronary artery disease, by 92% for diabetes, and by 60% for cancer**

Adams et al, Long-Term Mortality after Gastric Bypass Surgery N Engl J Med 2007; 357:753-761

# NEJM Editorial

***"Has the time come to reconsider BMI guidelines for bariatric surgery? In addition to the improvement in the risk of diabetes, the reduction in deaths from cancer may also argue in this direction. Sjöström et al. and Adams et al. show that weight loss saves lives in obese patients. Thus, the question as to whether intentional weight loss improves life span has been answered, and the answer appears to be a resounding yes"***

# RCT: Surgery vs Medical Therapy - Stampede Trial

- RCT: 150 patients
- Med Rx vs RYGB vs LSG
- Primary outcome proportion of patients with HbA1c of 6% or less at 12 months
  - Med Rx: 12%
  - RYGB: 42%,  $p=.002$
  - LSG: 37%,  $p=.008$

A Change in Glycated Hemoglobin

Value at Visit

Intensive medical therapy	8.9	7.7	7.1	7.4	7.5
Roux-en-Y gastric bypass	9.3	6.8	6.3	6.4	6.4
Sleeve gastrectomy	9.5	7.1	6.7	6.7	6.6

Schauer et al Bariatric Surgery vs Intense Medical Therapy in Obese Patients with Diabetes NEJM March 2012

# RCT: Surgery vs Medical Therapy – Rome Trial

- RCT: 60 patients
- Med Rx vs RYGB vs BPD
- Primary outcome proportion of patients with HbA1c of 6.5% and fasting glucose <5.6 mmol at 24 months
  - Med Rx: 0%
  - RYGB: 75%,  $p < .001$
  - LSG: 95%,  $p < .001$

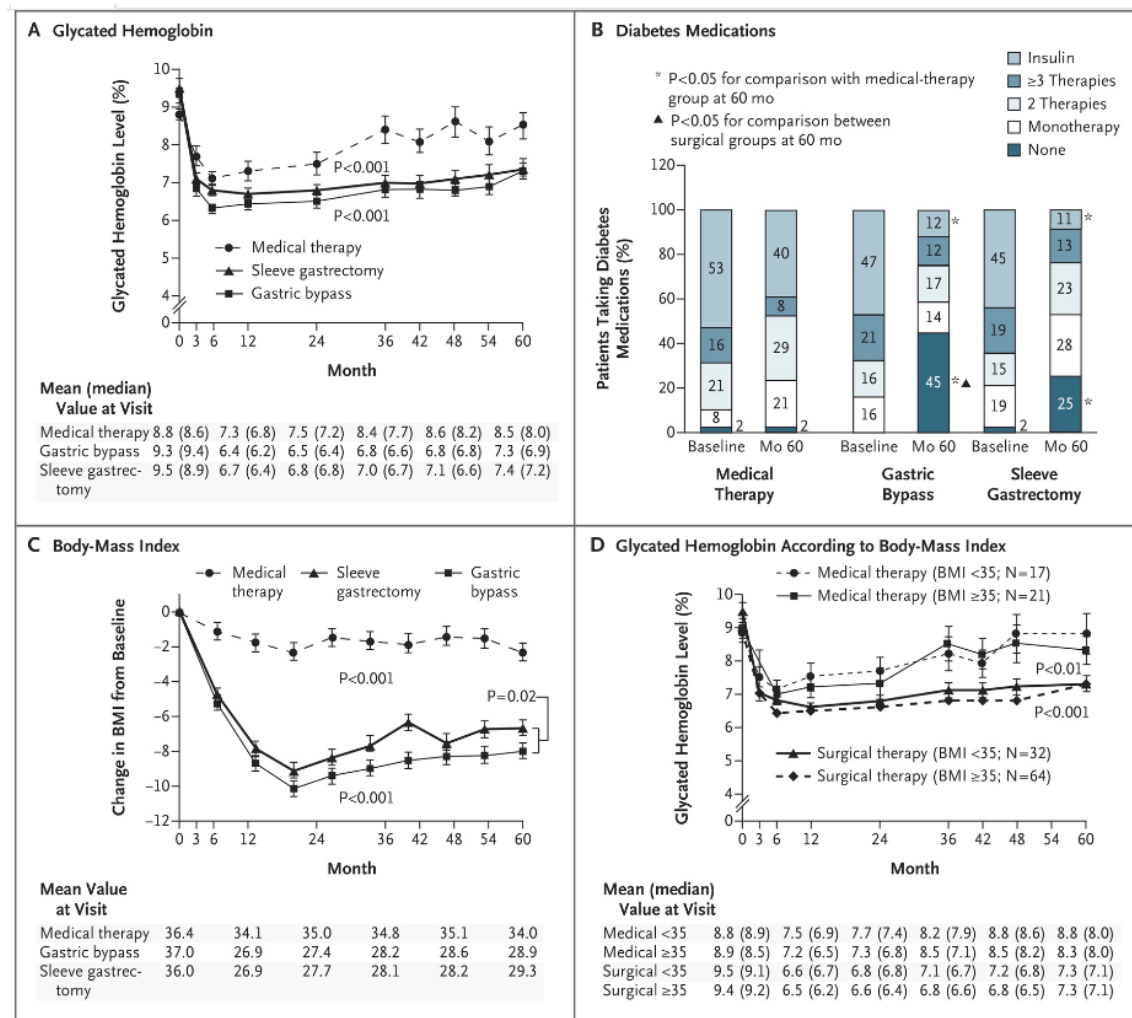

*Bariatric Surgery vs Conventional Medical Therapy for Type 2 Diabetes NEJM March 2012*

# Stampede Trial: 5 years

**Over 88% of surgical patients had glycemic control considered 'very good to acceptable' (average glycated hemoglobin level of 7.0%) without the use of insulin**

**Majority of surgical patients who achieved a glycated hemoglobin level of 6.0% or less reached that target without diabetes medications, whereas none of the patients in the medical-therapy group reached that target without the use of diabetes medications**

Schauer et al Bariatric Surgery vs Intense Medical Therapy in Obese Patients with Diabetes – 5 year outcomes NEJM Feb 2017

# Escape Diabetes Risk Calculator

**Determines 10 year risk with/without weight loss surgery**

**Images facilitate understanding risk reduction**

## 10-year Individualized Diabetes Complications Risk Scores

A screenshot of the "10-year Individualized Diabetes Complications Risk Scores" calculator. The form is titled "ESCAPE DIABETES" and has a "BETA" label in the top right corner. It has four tabs: "Demographics", "Medical History", "Clinical and Lab Data", and "Current Medications". The "Demographics" tab is active. The form contains several input fields: "Age (years)" with a dropdown menu showing "18-80"; "Sex" with a dropdown menu showing "Select a sex"; "BMI (kg/m²)" with a text input field showing "30-100"; "Race" with a dropdown menu showing "Select your race"; and "Smoking status" with a dropdown menu showing "Select your smoking status". At the bottom of the form are two buttons: "Reset" with a circular arrow icon and "Next" with a right-pointing arrow icon.

<https://asmbs.org> › [escape-diabetes](#) › [risk-calculator](#)

If you need to calculate your body mass index (BMI), use the ASMBS BMI Calculator.

The Individualized Diabetes Complications (IDC) Risk Scores provide personalized evidence-based risk information for patients with type 2 diabetes and obesity about their future risk of cardiovascular outcomes and death, based on current status of obesity, diabetes, and related health conditions, with and without bariatric and metabolic surgery. The calculator has been constructed from data of near 14,000 Cleveland Clinic patients with type 2 diabetes and obesity to predict 10-year risk of developing major adverse cardiovascular outcomes. If you already have one of these adverse outcomes, the calculator does not predict the future risk for that specific outcome.

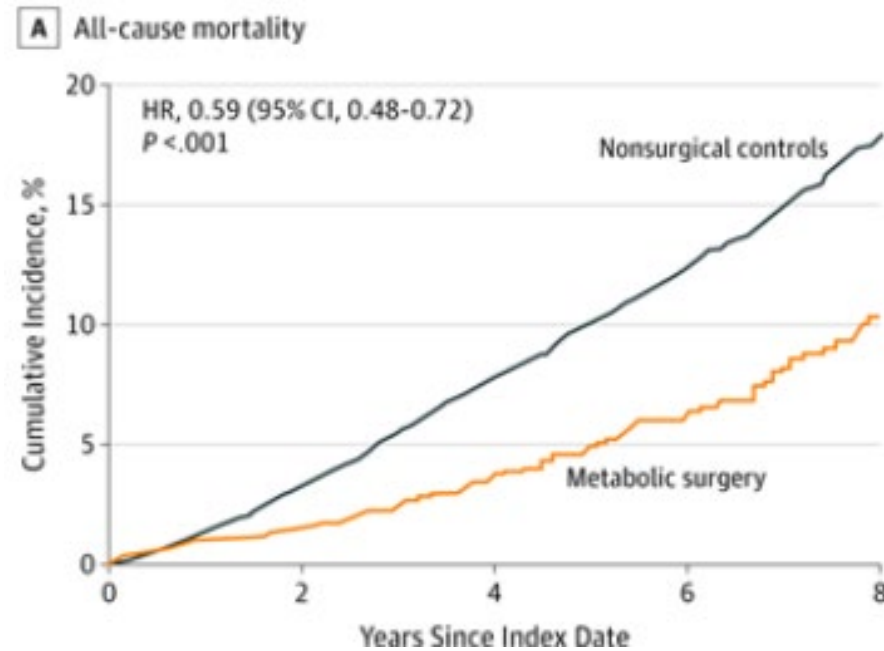

# SOSS: Bariatric Surgery as Prevention of Type 2 Diabetes

**SOS study: non-randomized/prospective/controlled intervention trial comparing long term effects of bariatric surgery with usual care**

- **Sept 1987-2001 accrual: 2010 pts surgery, 2037 matched controls**
- **Current study: 1658 surgery, 1771 controls without diabetes**

*Carlsson et al Bariatric Surgery and Prevention of Type 2 Diabetes in Swedish Obese Subjects NEJM Vol 367 Aug 2012*

**In this retrospective cohort study of 13 722 patients (including 2287 patients who underwent metabolic surgery and 11 435 matched controls), metabolic surgery was significantly associated with a lower risk of major adverse cardiovascular events (hazard ratio, 0.61).**

**Association of Metabolic Surgery With Major Adverse Cardiovascular Outcomes in Patients With Type 2 Diabetes and Obesity**

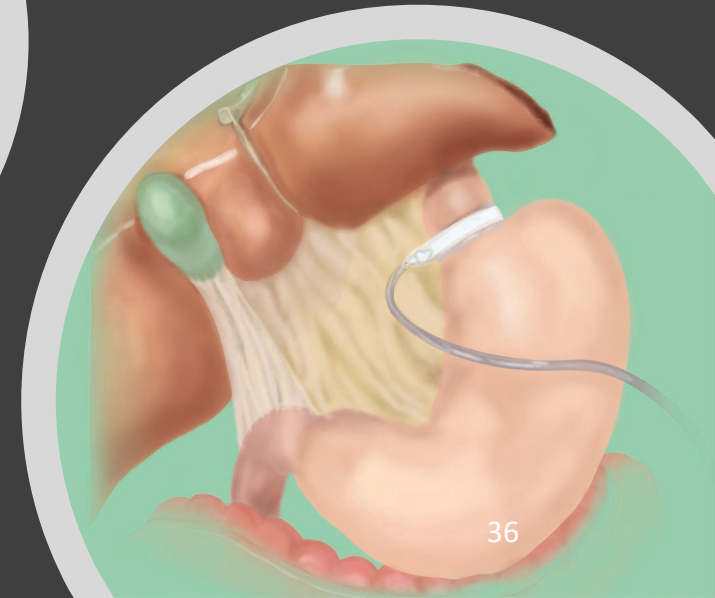

JAMA. Published online September 02, 2019. doi:10.1001/jama.2019.14231

# Surgical Procedures You Need to Know

**Gastric Bypass**

**Adjustable Gastric  
Band**

# Indications for Bariatric Surgery

## **NIH Recommendations**

*Gastrointestinal Surgery for Severe Obesity. NIH Consensus Statement Online 1991 Mar;9(1):1-20*

Patients whose BMI exceeds 40 are potential candidates for surgery if they strongly desire substantial weight loss because obesity severely impairs the quality of their lives. They must clearly and realistically understand how their lives may change after operation.

In certain instances less severely obese patients (BMI's between 35 and 40) also may be considered for surgery. Included in this category are patients with high-risk co-morbid conditions such as life-threatening cardiopulmonary problems

- severe sleep apnea
- severe diabetes mellitus
- *physical* problems interfering with lifestyle
- (e.g., joint disease treatable but for the obesity, or body size problems precluding or severely interfering with employment, family function, and ambulation)

# Evolution of Indications for Surgery

- **Type 2 DM: BMI < 35kg/m<sup>2</sup>**
- **Ethnicity: Asian, first nations, middle eastern suggests greater susceptibility to comorbid disease (Type 2 DM) at lower body weight**
  - **Lower BMI threshold by 2.5-5 kg/m<sup>2</sup>**

# Mechanisms of Action

**“Surgical alteration in gastrointestinal anatomy that leads to early changes in metabolism and gut physiology”**

- **Reduced hunger hormones and increased satiety hormones**
- **Impact on metabolic ‘set point’**
- **Impact on microbiome**

# Metabolic Change over Time

- **Significant reduction in Basal Metabolic rate along with other factors impacting total energy expenditure**
- **1-2% per decade after age 20, then after age 40 accelerates to as much as 10% per decade**
- **Impact on interpretation of weight gain following weight loss surgery in the aging patient**

# Early Complications

<https://riskcalculator.facs.org/bariatric/>

- **Post operative internal bleeding: 0.5-1.0%**
- **Post operative leak from staple line/anastomosis: 0.5-1.0%**
- **Wound seroma/infection: 5%**
- **Thromboembolic disease: 0.5-1.0%**
- **Anastomotic ulcer/stricture: 1.0%**

# Late Complications/Side Effects

<https://riskcalculator.facs.org/bariatric/>

- **Sleeve gastrectomy:**
  - **Reflux syndrome (mixed acidic, alkaline reflux), 5%**
  - **Post operative surveillance gastroscopy**
  
- **Gastric bypass:**
  - **Ulcer/stricture of gastrojejunostomy , 5%**
  - **Internal hernia (small bowel volvulus/obstruction), 0.5%**
  - **Dumping syndrome**
  - **Iron deficiency, vitamin/trace element deficiencies**
  
- **Excess abdominal/truncal extremity skin: 50%**

# Choosing Wisely: Bypass vs Sleeve?

- **Consider: age, BMI, reflux, diabetes, GI disease/surgery, patient preferences, weight loss goals, reversibility**
- **Sleeve gastrectomy**
  - **Increased age**
  - **No GERD/Barrett's**
  - **Hx of GI Dx/Sx**
- **Gastric bypass:**
  - **Decreased age**
  - **Type 2 DM**
  - **Reversible**

# How to Refer

- **Alberta Health Services: referral form**
  - *<https://www.albertahealthservices.ca/frm-18205.pdf>*
- **Consultation with physician/surgeon for complex cases**
- **Arya Sharma**
- **Ren Modi**
- **Sabrina Kwon**
- **Sarah Chapelsky**
- **Sarah Cawsey**
- **Dan Birch**
- **Shahzeer Karmali**
- **Aliyah Kanji**
- **Noah Switzer**

# Where to Refer

- **Primary clinic: primary management of obesity and comorbid disease**
- **Revisional clinic: management of patients who have had surgery out of province, country or legacy procedures**

# ASMBS MBSAQIP

The American College of Surgeons (ACS) and the American Society for Metabolic and Bariatric Surgery (ASMBS) combined their respective national bariatric surgery accreditation programs into a single unified program to achieve one national accreditation standard for bariatric surgery centers, the Metabolic and Bariatric Surgery Accreditation and Quality Improvement Program (MBSAQIP®).

*MBSAQIP works to advance safe, high-quality care for bariatric surgical patients through the accreditation of bariatric surgical centers. A bariatric surgical center achieves accreditation following a rigorous review process during which it proves that it can maintain certain physical resources, human resources, and standards of practice. All accredited centers report their outcomes to the MBSAQIP database*

Currently, there are more than 800 MBSAQIP-accredited centers in the United States and Canada, and more than 200,000 bariatric cases are captured annually in the MBSAQIP Registry. The program is celebrating its five-year anniversary in 2019.

# THANK YOU
